

Heermann Maschinenbau GmbH

HEMA, specialist for band saws and cutting systems

Honeycombs, foams, or composite materials – these partly highly-specific materials used in lightweight construction have been our daily challenges for many years now. Our know-how is our customers' advantage with regard to highly-precise cutting processes, perfect cut surfaces, and efficient automation modules. We assist our customers in all steps, from material development to certification and preparing the products for serial production. In addition to the technical solutions, we consider the profitability of the future production lines as early as in the development phases of new products, always keeping in mind the ecological aspects and the goal of optimal productivity. With our years of experience as a supplier to the aerospace industry, we have significantly contributed to the strengthening of Baden-Württemberg as a production location in the long term, and to its forward-looking expansion.
